DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over either one of JP 8-167769 (JP '769) or JP 6-077629 (JP '629), in view of U.S. Patent No. 4,983,252 to Masui et al. (Masui). Both JP '769 and JP '629 disclose a process of forming a circuit pattern comprising the steps of providing a metal layer on a substrate having a sloped portion, electrodepositing a resist on the metal layer, and scanning a laser beam over the surface of the electrodeposited resist to define a pattern. See the abstracts and Figures 1-4 of JP '769, and the abstracts and Figures 1-3 of JP '629. However, neither JP '769 nor JP '629 disclose using an excimer laser as the imaging laser. Masui discloses a process for producing a printed circuit board, wherein an electrodeposited resist is imaged with an excimer laser to define a pattern. See the abstract; column 2, lines 22-26; and column 4, lines 25-40. It would have been obvious to one skilled in the requisite art to use an excimer laser, as taught by Masui, as the imaging laser in the process of either one of JP '769 or JP '629 because it is taught that electrodeposited resist can be imaged with excimer lasers having a short wavelength so as to form high density wiring patterns in a short period of time.
